

*SMELLY HEAD or BILGE?  
FOUL-TASTING POTABLE WATER?*

Our Yacht Maintenance Services now include the use of **Selectroicide<sup>®</sup>** - 2L 500, a powerful, revolutionary product from Selective Micro Technologies that disinfects and deodorizes on-board water and waste systems and spaces where foul tastes and smells come from bioslime.

This product employs a point-of-delivery micro-reactor generating a chlorine dioxide solution which kills bioslime in the potable and black water tanks, including the tanks' head spaces. Bleach can now be a thing of the past with far less fresh water needed to rinse your boat's plumbing system after treatment.

We have used **Selectroicide<sup>®</sup>** to disinfect the lines between the potable water tank and the gallery and/or head. At the galley, good-tasting water can be restored. In the head, both the shower water and the commode can be relieved of bad odor.

Besides restoring the on-board potable water and waste tank systems to odor-free operation, **Selectroicide<sup>®</sup>** may also be used to rid your boat's bilge or cockpit drain of foul odor.

We recommend that you consider adding the **Selectroicide<sup>®</sup>** disinfecting and deodorizing service to your list of items taken care of by us at haul-out or prior to spring launch.
